

# ECO-Crisis Command: Hackathon Pitch Script

## 1. The Hook (Introduction)

Hello judges! Have you ever wondered what happens during a massive natural disaster when phone lines are jammed, human dispatchers are overwhelmed, and every second counts?

Our project, ECO-Crisis Command, solves this. It is a next-generation, AI-powered emergency management platform. It acts as a digital "brain" that connects civilians reporting disasters directly to autonomous AI agents that deploy resources instantly.

## 2. The Tech Stack (How it's built)

Before I show you the demo, here is a quick overview of our architecture:

- The Frontend is built using React and Tailwind CSS. It features a highly interactive, global WebGL map powered by MapLibre.
- The Backend runs on a Node.js and Express server, communicating in real-time.
- The Database is a secure PostgreSQL database that stores all historical incident data and user roles.

## 3. The Core Concept (Users vs. Admins)

Our platform has two main views:

First, we have the Civilian User. If a civilian is caught in an emergency, they can open their dashboard and quickly submit an incident report—like a flood or a fire—and specify which agency needs to help.

Second, we have the Admin Commander. The admin looks at our beautiful global map. On this map, we use universal emojis to instantly communicate disaster types—like a fire icon in Australia, or a radiation icon in Shanghai. This gives the commander a "God's-eye view" of the world.

## 4. The Live Demo (Action Steps)

*(At this point, have two browser windows open side-by-side: one Admin, one User).*

Let me show you how it works in real-time. Right now, on the left, our Admin is monitoring the global map. On the right, I am a civilian trapped in a new emergency.

*Watch what happens when I submit this incident report... (Click submit on the User side).*

...Instantly, without the page even reloading, the Admin receives a tactical audio alert, the notification bell pulses red, and the new incident is dropped right onto the global map!

## 5. The Secret Sauce (AI Agents)

But here is what makes our project truly innovative. The Admin isn't just looking at data; they are being assisted by Autonomous AI Agents working behind the scenes.

When that civilian reported the incident, our AI did three things:

- Assessed the severity and figured out exactly what resources were needed.
- Allocated available resources to the disaster automatically.
- Dynamic Replanning: If an ambulance breaks down on the way, our AI is smart enough to realize the failure and immediately re-plan by pulling a different resource to cover the gap.

If the AI ever gets confused or resources run out, it flags the situation for the human Admin to make the final call.

## 6. The Conclusion

In summary, ECO-Crisis Command isn't just a map. It is a real-time, AI-driven lifeline that assesses, coordinates, and adapts to emergencies faster than humanly possible. Thank you!
